NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions

Cambridge CB10 IRQ, England e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

IROPTFSQPISEELESKYGK"

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

cosmid is CO9D1, 13199 bp overlap; 3' end lies in a gap. start of this cosmid is at base position 197 of CELC24G7; end is at 46996 of CELC24G7 The 5' Actual actual

NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation). Location/Qualifiers .46996

Direct Submission

Submitted (11-SEP-1999) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Oct 16, 1999 this sequence version replaced gi:5881454.

* NOTE: This is a "working draft' sequence. It currently consists of 23 contigs. The true order of the pieces

* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as trues of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                      Drosphila melanogaster chromosome 3L/71F1 clone RPC198-21K15, SEQUENCING IN PROGRESS ***, 23 unordered pleces. AC010050

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Erric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Clone RGG11J21 is from the first release of the human BAC library CITB-978SK-B. The library contains cloned DNA from the male fibroblast cell line 978SK. See: Shizuya et al., Proc. Natl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhin; Hominidae; Homo.

**NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Cloning of a cDNA encoding the human cation-dependent mannose 6-phosphate-specific receptor Natl. Acad. Sci. U.S.A. 84 (16), 5575-5579 (1987) 87289647

The protein is a presumptive prepropeptide, though the cleavag site for the mature peptide was not determined. Draft entry and computer readable copy of sequence [1] kindly provided by K.von Figura, 01-OCT-1987.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note-"mannose 6-phosphate-specific receptor protein" 618 a 534 c 576 g 700 t 319 bp upstream of HindIII site; chromosome 12.

Colim 4; Producino. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access of the invention. The DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences of computer readable medium.

Computer readable medium.

claim 1; Pages 40'41; 67pp; Japanese.

This represents a floral organ-specific chitinase encoding gene sequence along with a floral organ-specific promoter sequence. The promoter derived from rice associated with chitinase is specific to floral organs and allows expression of genes in the flower parts of monocotyledonous plants. The expression of desired genes specifically in the floral parts
                                                                                                                                                                                                                                                                                                                                                                                               V49983;
10-NOV-1998 (first entry)
Floral organ-specific chitinase gene with promoter sequence.
Floral organ specific gene: chitinase; promoter; Orga sativa; rice;
flower part; monocotyledonous plant; bacterial resistance; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. .1234

insert in a positive clone was 1.6kb. An 80bp riboprobe was prepared from the 5' terminal of the 1.6kb insert and used to rescreen the library. The largest cDNA insert was cloned into pGEM-7z to obtain pGEM-7z-rcgntl. The full-length rabbit GnT coding sequence was eventually obtained from overlapping clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Promoter sequence associated with chitinase, specific to floral organs - allows expression of genes in the flower parts of monocotyledonous plants

08-JUN-1999 (first entry)

Human anti-anglogenic hPRL Met-1Cys199 antisense DNA. HPL; anglogenesis; growth hormone; hGH; hGH-V; capillary endothelial cell proliferation; placental vascularisation; pregnancy; treatment; anglogenic disease; tumour; inhibitor; malignant; anglofibroma; arteriovenous malformation; arthritis; atheroscalerotte plaques; corneal graft neovascularisation; arthritis; anglogeneration; granulation; glaucoma; ocular; uveitis; fracture; Osler-Weber syndrome;
of monocotyledonous plants, allows modifications to be made in the structure or function of these parts allowing the introduction of desired characteristics such as increased resistance to bacterial attack. Sequence 2636 BP; 722 C; 696 G; 561 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to: 110000

This invention describes a novel rice anthranilate synthase first isozyme alpha-subunit. The encoding DNA can be used to produce transformant plants and seeds, of e.g. rice, maize or wheat, with enhanced tryptophan content and nutritional value of the crops. 25-JUN-1999 (first entry) first isozyme alpha-subunit DNA. Rice anthranilate synthase first isozyme alpha-subunit; ASA; rice; isozyme; plant; seed; maize; wheat; tryptophan content; nutritional value; ss.
P-PSDB; W93815.

NAM encodes ^a-subunit of first isozyme of rice anthranilate
Synthase - used for improving tryptophan production and
nutritional value of crops, e.g. rice, maize or wheat
Claim 8; Pages 142-145; 152pg; Japanese.
This invention describes a novel rice anthranilate synthase first
isozyme alpha-subunit. The encoding DNA can be used to produce
transformant plants and seeds, of e.g. rice, maize or wheat, with
enhanced tryptophan content and nutritional value of the crops.

                                                                                                                                                                         Claim 1; Page 16-26; J6pp; English.

Claim 1; Page 16-26; J6pp; English.

The present sequence represents human OCIF genome DNA which is specifically claimed in the present invention. The present invention of coreclasts specifically claimed in the present invention. The present invention of coreclasts of and/or antipyretic proteins, which have the following characteristics:

(1) And determined by SDS-PAGE of approximately 60 kDa under reducing conditions, and 60 kDa and 120 kDa under non-reducing conditions; and 60 kDa and 120 kDa under non-reducing conditions; and 60 kDa and 120 kDa under non-reducing conditions; (ii) a sequence (III) (see W53239); (iii) affinity to cation exchangers and heparin; (iv) its osteoclast formation inhibiting activity reduced by heating at 70 degrees Celsius for 10 minutes, and (2) a method for preparing at 90 degrees Celsius for 10 minutes, and (2) a method for preparing the above proteins. The proteins are useful for, e.g. treatment and convention of osteoprosis, rheumatism or multiple sclerosis, and also as antigens for immunological diagnosis of these diseases and disorders. X20248 to X20402 represent polynucleotide sequences isolated from Borrella burgdorfer! (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrella belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrella causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                                                      Borrelia burgdorferi polynucleotide sequence #11.

syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases.

/clone="Sheared DNA-22K17"
/clone="Trypanosoma brucei from a cloned population of Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTAt 10.1) was mechanically sheared to give a tight size distribution (approx 2 kb).
The v + imethod used for the library construction is described in detail in Smith, H.O. and Venter, J.C.
(Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barelli, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Int. Clones are derived from the Trypanosoma brucei GUTat 10.1 sheared
DNA library constructed at TIGR. Clones will be available for
distribution through ATCC. Sheared DNA end sequences search page:
http://www.tigr.org/tdb/mdb/tbdb/.
Seg primer: M13-Forward
Class: shotgun.
                                                                                                                                                                                                                                                                                                                                                                                                 Trypanosoma.

The sequence tag present in the CDNA between the NoI site and the oligo-dr track served to verify it as a clone from the non-normalized hypothalamus library cDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP CDNA clones, this record will be updated accordingly when that means is determined. Seg primer: MI3 Forward

The sequence contained an oligo-dr track that was present in the coligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dr track served to identify it as a clone from the normalized pineal glands library cDNA Library Preperation: M.B. Soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. POLYA-YES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polylinker; Site_1: Not I; Site_2: Eco RI; The WILBAMP_M.S. library is a subtracted library derived from NIH_BMAP_M.S.1 which in turn is a subtracted library derived from a mixture of normalized libraries from ten regions of the mouse brain (cerebellum, brain stems, olfactory bulbs, hypothalamus, cortex, amydala, basal gangila, pineal gland, striatum, hipoccampus). The driver used for subtraction consisted of a pool of 5,000 clones from the NIH_BMAP_M.S.1 library and a pool of 5,000 clones obtained from non-normalized and normalized mouse brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 407)

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the Oligo-dT track served to verify it as a clone from the normalized olfactory bulbs library CDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined.

Whis 92-19402/725.

Tomposns. comparising lymphoid surface membrane proteins - which may finhibit cytolytic activity and differentiation of CTLS.

Example 12, 29pp; English.

Example 12, 29pp; English.

R95413, and R95415-R9543 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the protein associated with T-cell activation in mammalian T-cells, and is protein associated with T-cell activation in mammalian T-cells, and is a lise immunologically cross reactive with the heat shock protein Hsc70.

Top 14 is found in a limited number of cell types, but is particularly compositions of an anticell types, but is particularly colly with an amphoteric detergent, and then passed through an affinity colly min containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with the AB2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of determining the amount of binding between the candidate compound and p74.

Containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74 in an amount sufficient to compete with p74 for the binding of the p74 ligand.

```
New immunomodulating dimer peptide(s) - based on a Class I HiA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases.

Per treating activity, including the N-terminal acylated and/or corporate compruse the formune is claimed which has a for the advisor.

Per treating amidated or esterified forms of up to 60 amino acids, where the formula; A-B, where A, B = corp.

Per son N; aa39 = R or G; aa80 = 1 or N; aa81, aa84 = a hydrophobic or caid. The sequence in the brackets may optionally be absent or truncated at my peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HiA-B alphal domain (positions or any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HIA-B alphal domain (positions or 17e4). They can be used to inhibit cytocoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CDS. The peptide can be used for preventing rejection consument diseases, e.g. diabetes, the common of the compound or treating autoimmune diseases, e.g. diabetes, consumence the manner of the compound or the consumence of transplants or for treating autoimmune diseases, e.g. diabetes, consumence the consumence of the consumence o

claimed which has immunomodulating activity, including the N-terminal activity activity and the control amidated or esterified forms of up to 60 mino acids, where the peptide-type compound comprises the formula: A-B, where A, B = (R aa76-77L) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a represents amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid; are sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proteins of interest to activate CTLs. They can also inhibit the consequently rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus errythematosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R82907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to abuther deriod of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/75-84)
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Clayberger C, Krensky AM, Parham P; WPI; 95-358582/46.
Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Example; Page 12: 29pp; English.

Example; Page 12: 29pp; English.

R95413, and R95413-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the reprotein p74 from a T-cell lyaste. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HS70.

P74 is found in a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing a covalently bound HLA-B2702 palindromic peptide.

Column containing the extracellular fragment of p74 combined with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete containing the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ï

This sequence represents a specifically claimed immunomodulating dimension. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal activity, including the N-terminal activity, including the N-terminal activity, including the N-terminal activity, where the peptide-type compound comprises the formula: A-B, where A, B = (R anf6-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a represents amino acid; The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid; sequences related to a class I HLA-B alphal domain (positions 78-84). They can be used to inhibit cycloxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in proteins of interest to activate CTLs. They can also inhibit the proteins of interest to activate CTLs. They can also inhibit the proflemation of T cells in response to anti-CD3, The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New prostaglandin E receptor protein and DNA encoding it - used to study prostaglandin binding, agonists and antagonists etc. Claim 5, 10; Figure 4; 22pp; English.
The prostaglandin E receptor can e used to clone other PGE receptor genes, to clarify the structure of PGE receptors, to elucidate the function of PGE and to identify PGE agonists/ antagonists. The receptor is produced by recombinant methods,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .,

transforming a host cell, culturing the cell and retrieving the recombinant protein from the culture medium. This PGE2 receptor is a derivative of the clone MP600 (Q66124) having 99 base pairs deleted from the coding sequence resulting in replacement of 30 C-terminal amino acids with a different sequence of 26 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /label- Phosphorylation site.

The prostaglandin Erceptor can be used to clone other FGE receptor genes, to clarify the structure of PGE receptors, to elucidate the function of PGE and to identify FGE agonists/ antagonists. The receptor is produced by recombinant methods, transforming a host cell, culturing the cell and retrieving the recombinant protein from the culture medium.

Tractment of diseases.

Claim 2: Page 43-45: 64pp: English.

The sequence represents a human uterus prostaglandin-EP3-9

Treceptor (mol. wt. 40,507). The sequence contains 4 conserved receptor (R69515) in transmembrane region-vii common to cher EP3 receptors. Conserved Cys residues are found in exofacial loops 1 and 2, and a conserved Arg found in all ecosanoid receptors is found in transmembrane region-vii. The receptor-antagonists, for use in therapy of e.g. glaucoma, side-effects of non-steroidal antinflammatories, cancer, metastasis, renal vasoconstriction, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

New human prostaglandin EP3 receptor(s) - useful for treatment and prevention of, e.g. inflammation claim 8; Pages 20-21; 27pp; Japanese.

This represents a human EP3-VI receptor. A replication or expression vector comprising cDNA sequences encoding EP-3V or EP3-3VI can be used to transform a host cell. The host cell is cultured and the polypeptides can be recovered from the culture medium. The polypeptides combine specifically with a prostaglandin PGE2 receptor and can be used as a preventive and treating agent for inflammation.
                                                                            New prostaglandin EP3 receptors and DNA - used partic. to identify modulators of prostaglandin receptor activity for treatment of diseases.

Treatment of diseases.

Claim 2: Page 40-41: 64pp: English.

The sequence represents a human kidney prostaglandin-EP3-alpha receptor (moll-Wt. 43.315). The sequence contains 4 conserved region (R69515) in transmembrane region-VII which has conserved region (R69515) in transmembrane region-VII which has conserved region (R69515) in transmembrane region-VII which has genes. Conserved Arg found in all eicosanoid receptor genes. Conserved Arg found in all eicosanoid receptors is found in transmembrane region-VII. The receptor may be used to identify receptor-agonists and receptor-antagonists, for use in therapy of e.g. glaucoma, side-effects of non-steroidal antiinflammatories,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   19-AUG-1998 (first entry)
Human prostaglandin EP3-VI receptor.
Prostaglandin E2 receptor; EP3-V receptor; human; treatment; inflammation; EP3-VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   58.6%; Score 34; DB 1; Length 393; 77.8%; Pred. The sequence represents a human uterus prostaglandin-EP3-21
receptor (mol.wt. 42,688). The sequence contains 4 conserved
N-glycosylation sites in putative extracellular regions, and a
conserved region (R69515) in transmembrane region-VII common to
other EP3 receptors. Conserved Cys residues are found in
exceptors is found in transmembrane region-VII.
eicosanoid receptors is found in transmembrane region-VII. The
receptor may be used to identify receptor agoinists and
receptor antagonists, for use in therapy of e.g. glaucoma,
side-effects of non-steroidal antiinflammatories, cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                   New human prostaglandin EP3 receptor(s) - useful for treatment and prevention of, e.g. inflammation (claim 2) Pages 16-17; 27pp; Japanese.

This represents a human EP3-V receptor. A replication or expression vector comprising cDNA sequences encoding EP-3V or EP3-3VI can be used to transform a host cell. The host cell is cultured and the polypeptides can be recovered from the culture medium. The polypeptides specifically with a prostaglandin PGE2 receptor and can be used as a preventive and treating agent for inflammation.
                                                                                                                                                                                                                                                                                                                                                                                   12-SEP-1997 (first entry)
POLYprotean of attenuated DEN-2 virus, strain 16681, PDK-53.
Dengue 2 virus; polyprotean; capsid; prM; M; E; NS1; NS2A; NS2B; NS3; NS4A: NS4B: NS5: PDK-53; quadravalent vaccine; immunity; serotype; chimeric DEN-2/1 virus; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome; DEN-2/5 NESS.

PDK-53, a clone of infectious attenuated Dengue 2 virus strain 16681

The also chimeric DEN-2/1, DEN-2/3 and DEN-1/4 viruses, used as a quadravalent vaccine for protecting against Dengue virus infection claim 27; page 122-136; Sclipp; English.

Claim 27; page 122-136; Sclipp; English.

Claim 27; page 122-136; Sclipp; English.

Claim 16681. The attenuated virus is designated DEN-53. The polyprotein comprises the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins. A clone of this wildtype viral sequence, PDK-53, may be used in the production of a quadravalent vaccine which provides immunity against all four serotypes of dengue virus. The vaccine also comprises a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue hemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant protein products of the DNA constructs of common and the vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1.5EP-1997 (first entry)

NAN-directed RNA polymerase (EC 2.7.7.6) 22K chain - vaccinia virus (strains WR and C C) Species vaccinia virus

Nilternate names: J4R protein
C;Species: vaccinia virus
A;Note: host Homo sapiens (man)
C;Date: 28-Dec-1987 #sequence_revision 28-Dec-1987 #text_change 11-Jun-1999
C;Accession: A25734; I23092; G42513
